

Week 1

When it comes to server-side and client-side I would like to think that they're both different but both play major roles. I think that they're both as important one wouldn't work without the other. Client-side tend to focus on creating parts of a website or application that users can see, such as visual design elements and web page layouts. However, Server-side developers focus more on behind-the-scenes components like how an application transmits data to a server. When it comes to comparing these two I think the server side is more powerful since rendering can speed up page load times, which not only improves the user experience, but can help your site rank better in Google search results. However display and visual design is also a huge role too. It's really hard to say which is better, I think they're both as important.
